Tic-Tac-Toe Winning Move Detection

Author : MALEK Amina

Difficulty Level : Easy

Description

A developer is working on an AI to analyze Tic-Tac-Toe games. To assist in strategy development, they need a tool that checks whether the **last move** in a sequence of Tic-Tac-Toe plays results in a winning configuration for the player who made that move.

Your task is to write a function that analyzes a given sequence of valid moves and determines if the last move led to a win.

The game is played on a 3x3 board. 'X' always plays first, and players alternate turns. A move is represented as a pair of integers [row, col].

Input

You will be given 1 line:

- A 2D list of moves where each move is a list of two integers [row, col] representing the position on the board.

Output

Return a boolean:

- True if the last move resulted in a win.
- False otherwise.

Note

- The board is of fixed size 3x3.
- A player wins by placing three of their marks in a horizontal, vertical, or diagonal row.
- The length of moves will be between 1 and 9.
- All moves are guaranteed to be valid and non-repetitive.
- 'X' plays first, followed by 'O', and so on.

Examples

Input	Output
0 0 1 1 0 1 2 2 0 2	True
0 0 1 1 0 1 2 2	False
