Laser Blind Zones

Author: Amine Charef

Difficulty: Hard

Description

You are given an m x n grid of integers, where each number represents the height of a wall segment inside a secure facility.

Laser beams are placed along the **left and right sides** of the facility and shine horizontally into each row. Lasers move **left to right** and **right to left**, but they **reflect back** when hitting a wall that is taller than or equal to the current height — meaning the laser can't pass through.

Any space that **cannot be reached by lasers from either side** of its row is considered a **hidden zone**, fully shielded from outside view.

Your task is to find the **total volume of hidden space,** that is, the number of unit blocks that are **invisible** to any side laser because they are completely blocked by taller or equal-height walls on both the left and the right.

Examples

EX1

Input: blocksMap =

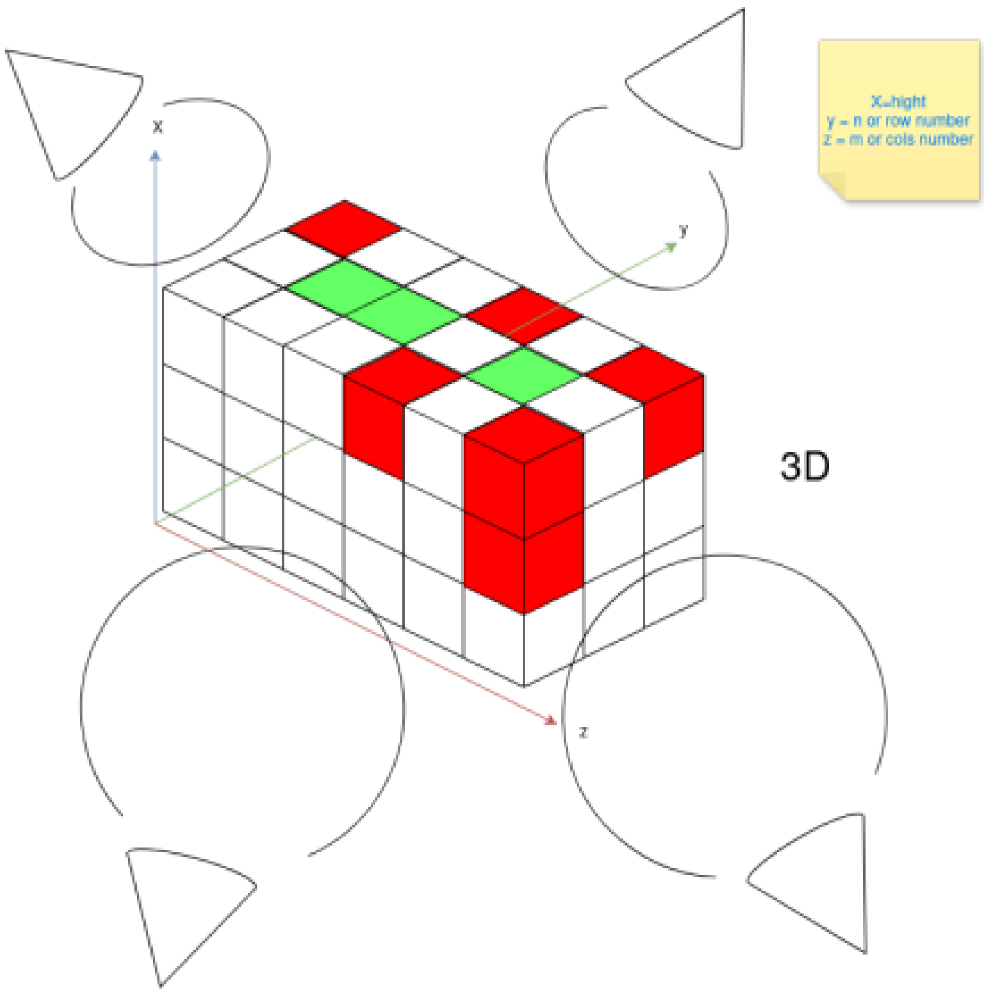
1 3 3 1 3 2

3 2 1 3 2 3

3 3 3 2 3 1

Output: 4

Explanation:



1	3	3	1	3	2
3	2	1	3	2	3
3	3	3	2	3	1

2D

EX2

Input: blocksMap =

1 3 3 1 3 2

3 2 1 3 2 3

3 3 2 3 3 1

Output: 2

Explanation: same as the first example but try to visualize it

Constraints:

- m == blocksMap.length
- n == blocksMap[i].length
- 1 <= m, n <= 200
- 0 <= blocksMap[i][j] <= 2 * 10^4
