

COVID-19 RNA Detection

Author : Ghemam Nabil

Difficulty Level : Easy

Description

A lab technician is analyzing RNA sequences to detect whether a person is infected with COVID-19. The technician compares the given RNA sequence against a list of known COVID-19 genetic markers.

Your task is to help the lab technician by writing a program that checks whether any of these known markers exist within the input RNA sequence.

Given an RNA sequence (a string made up of the characters A, C, G, and U), determine whether it contains any of the known SARS-CoV-2 RNA markers.

Input

You will be given 1 line:

- RNA sequence

Output

Return a boolean:

- **True** if it contains any of the known SARS-CoV-2 RNA markers.
- **False** otherwise.

Note

- RNA sequence can be up to 1000 characters long.
- Only the characters A, C, G, and U are allowed.
- The known COVID-19 RNA markers are:
 - **ACGUAUGC**
 - **AUGCGUAG**
 - **UGCUAGCU**

Examples

Input	Output
AGUCGACGUACGUAUGCUGCAU	True
UCGUAGCUAGCUACUAGCUGAC	False
