

Jumping Rules

Author: Okba Allaoua

Difficulty: easy

Description

The ESI Olympics wanted to introduce a brand new competition this year which is the **Hurdle Challenge**! where participants jump over hurdles, but unfortunately it didn't take place due to the unfair hurdles made!

Create a function which takes in an array of strings, representing hurdles, and returns whether or not they are ***unfair***. For the purposes of this challenge, unfair hurdles are:

- At least **4 characters tall**.
- Strictly less than **4 spaces** apart.

Inputs

- Enter line by line strings which each line represents the level of one height of the barrier

Outputs

- true if the hurdle is **unfair** else false according to the conditions listed in the description.

Constraints

- Hurdles will be represented with a hashtag "#".
- Note that the set of "#" in the same column means it's

the same hurdle!

- There will be the same spacing between hurdles.
- Hurdles are always as high as the length of the array.
- Hurdles are always evenly spaced.

Examples

Input	output
<pre># # # # # # # # # # # # # # # # end</pre>	True
<pre># # # # # # # # # # # # end</pre>	True
<pre># # # # # # # # end</pre>	False
